Use-Case Flow Specification

Metadata

Use Case Name: Submit Loan Application

Primary Actor: Borrower

System: Micro-Lending & Peer Credit Risk Assessor

1. Preconditions

 The Borrower has successfully registered an account on the platform and is currently authenticated.

 The Borrower does not have an active, unresolved defaulted loan on the platform.

2. Postconditions

 A new loan application is created and stored in the system database.

 The system assigns a preliminary Credit Risk Rating (Low/Med/High) to the application.

 The application is queued for Peer Lender visibility.

3. Main Success Scenario (Happy Path)

1. 1. The Borrower navigates to the 'Apply for Loan' dashboard.

2. 2. The Borrower enters the requested loan amount and preferred repayment term.

3. 3. The system prompts the Borrower to input their current debt obligations, income details, and employment history.

4. 4. The Borrower submits the required information.

5. 5. The system validates the inputs and executes the Compute Risk Rating use case (<<include>>).

6. 6. The system calculates the debt-to-income ratio and assigns a risk tier.

7. 7. The system displays a success message confirming the application and the assigned

risk tier.

8. 8. The system makes the anonymized application visible to Peer Lenders.

4. Alternate Flow: High-Risk Auto-Rejection

Condition: At Step 5 of the Main Success Scenario, the system's heuristic rules determine the debt-to-income ratio exceeds the maximum allowable threshold.

Flow:

9. 1. The system assigns a 'Critical Risk' tag.

10. 2. The system aborts the application submission.

11. 3. The system displays a rejection notification to the Borrower, citing the high debt-to-income ratio as the reason.

12. 4. The use case terminates; the application is not shown to Peer Lenders.
